

My opinion on the Google car is that I think that it was a cool creation, but very unsafe. The reason I believe that his is unsafe is because, for one reason, it is ran by a computer. that is bad because all computers can be hacked and if the computer was hacked, the person can make you crash or can bring you anywhere they want.

Another reason a Google care is an unsafe idea is because computers can be slow. If the computer was slow it may turn a corner late or too soon, it could also stop at a light or sign too late. There are many possibilities where you could crash if the computer was slow.

I also think that a self driving car is just helping the human race become lazier. I strongly think that the Google car is a bad idea. My reason for that is because the computer could be hacked or be too slow and both of those could lead to crashes. Plus, it will help humans become more lazy.

---

I think that the Google car is both good and bad. It has many benefits, such as blind people gaining the ability to drive and easier travel. However, it has many dangerous or bad thing about it. Computers crash, glitch, and lag all the time. How can we count on Google car to get us to the places we need when we know that the computer might fail at any moment?

Blind people now have the ability to drive, but we very well could kill all of them if the Google car fails and crashes. Even with the steering wheel and brakes still there, blind people are incapable of driving the car if the computer does crash. On the other hand, it offers more freedom to use your hands while in the car, preventing accidents caused by texting and driving.

Altogether, I feel that the Google car could turn out both ways. The computer in it could prove to be faulty, but the car gives freedom to travel to the handicapped. We will just have to wait and see where this takes us.
